Question 1: Imagine that you add Internet Explorer filters to a Website containing fixed images to enhance the images with a shadow. After adding the filters, it fails to work. Explain why this may have happened. Propose another solution that you can use to get the desired effect.

Mobile Websites, in most cases, should be simpler than standard sites. How could you design a mobile Website so you would not have to eliminate graphic elements?

Discussion Board

In today's world, anyone can create a website. The task of the programmer is to implement the wish of the customer. However, the web sites are not that simple oftentimes; there are also different filters for browsers which can restrict access to some websites. Nowadays, people use smartphones and tablets more often than regular computers. On these modern gadgets, not all of the web pages work properly.

Programmers usually create Mobile Websites which are simpler than common ones. On such web sites, graphic elements are already compressed. Layout for such websites is simple for computer browser, is normal for mobile browser and is adaptable for all screens. However, such work requires good layout skills.

Another solution is to create one website with smaller enlargement, which will be displayed on any electronic gadget. However, this variant is not substantial for large companies.

The first variant is the most versatile, though it requires great skills.
